Hazard-predicted bins (quartiles of h, h1 lowest to h4 highest; h is mostly a sand axis) vs weather-label bins, held-out test halves, mean ± 1 sd over 10 splits
h by weather label (ARI with quartile bins 0.07 ± 0.00)
Hazard scalar h (higher = lower contrast, fewer edges)
Fog
n = 283
Rain
n = 199
Sand
n = 320
Snow
n = 203
α = 0.1: miss fraction
Predicted bins h1–h4 (CRC per hazard quartile)
Oracle bins (CRC per weather label)
α = 0.1: false-positive cost
α = 0.2: miss fraction
α = 0.2: false-positive cost
